Summary

Software Developer with 4 years of experience in Java, Spring Boot, Quarkus, React, and AWS. I've built and maintained microservices, serverless APIs, and cloud-native systems across airline and agriculture technology. I focus on performance optimization, observability, and using AI-powered development tools to ship better code faster.

Education

Sir M Visvesvaraya Institute of Technology

Bachelor of Computer Science
Aug 2018 — Jul 2022

Technical Skills

Languages/Frameworks: Java (Spring Boot), Python, JavaScript, Node.js, TypeScript, React, System Design: Microservices Architecture, Data Structures, API Development (RESTful), Scalability & Performance Optimization, ETL Processes, AWS Cloud : Fargate, Lambda, S3, RDS, ECR, DynamoDB, DocumentDB, Cloudformation, CodeBuild, DevOps : CI/CD Pipeline, Github Actions, Git, Containerization, Docker, Linux CLI, Databases: SQL, AWS RDS, NoSQL (DynamoDB), Automation (Python Bots, GPT Integration), Microsoft Power Applications, Power Automate, Version Control, Code Review, Project Management

Soft Skills

Collaboration, Problem Solving, Time Management, Result Oriented

Work Experience

Delta Airlines

Jul 2025 — Present

Software Development Engineer

Contributed to Delta's Seamless Check-in platform enabling unified check-in across Delta and partner carriers.

- Helped migrate check-in APIs from ROSA (OpenShift) to serverless AWS Lambda behind API Gateway, improving scalability and cutting infrastructure costs.
- Replaced JBoss Data Grid with DynamoDB for the caching layer. Designed key schemas and TTL strategies to handle high-throughput check-in traffic and reduce calls to partner systems.
- Built an automated reporting tool that tracks API success rates across partner airlines, giving the team real-time visibility into check-in health and faster detection when something breaks.
- Cut CloudWatch EMF costs by 70% by removing redundant metric dimensions and streamlining how we emit metrics, without losing observability.
- Worked across multi-carrier check-in flows (OA*/DL and DL*/OA) involving PNR processing, travel document validation, and boarding pass generation with partner airline systems.
- Set up AI-augmented development workflows using agentic AI tools with custom rules and a domain-specific knowledge base. This lets AI coding assistants accurately trace API flows, debug production issues, and implement features with full context, which cut ramp-up time for new developers and improved code quality across the team.

Bayer Crop Science

Aug 2022 — Jul 2025

Software Development Engineer

ATLAS Blr-Taqman: Played a pivotal role in the development of the BlrTaqman workflow using Java Spring framework and microservices for the Precision Genomics team, ensuring collaboration and streamlining the DNA workflow

- Replaced Hellfire, a legacy platform-dependent app, with a modern web application that sped up DNA sample reaction processing by 20%.
- Delivered the MABC Workflow to production for the Bangalore Taqman lab in 7 months, increasing sample processing efficiency by 30%.
- Integrated the Auto Scoring model to cut manual scoring effort by 50%. Designed KPI data pipelines using AWS Lambda alongside this.
- Built an ETL job that automated a fully manual workflow, reducing that team's workload by 99%.
- Developed an Insect Control Lab application using MS Power Apps and a Node.js Express API backed by DynamoDB.
- Automated data sync between lab systems and AWS S3 with a secure multi-hop file transfer setup.

- Led application migrations for Precision Genomics projects, focused on performance and scalability in an Agile environment.
- Built a Python bot integrated with GPT-3.5 that reads documents and answers questions, cutting time spent on manual lookups.
- Awards: Top Performer, Passion in Action, Walk the Extra Mile, Star of BRC, Making a Difference, Bayspot.
